

## **Information from Covanta 13 July 2017**

We have recommenced heating up on oil last night as previously advised on our website.

If all goes well in that heating up phase and we are satisfied with some tests we will be carrying out at the minimum combustion temperature of 850c we will start to re-introduce waste into the boiler. This will happen at the earliest in late afternoon today Friday 14<sup>th</sup>.

In terms of visible effect there will be no change as we move from oil to waste. There will most likely be a white visible plume from one of the stacks and that will maintain as we move on to waste.
